

B+B products help save human lives!

Medical technology includes a wide range of technical processes and products. The aim of these products is to save lives, to support healing as best as possible and to improve the quality of life. B + B has also been developing high-precision temperature sensors and pressure transmitters for a wide range of applications in medical technology for several years. These are implemented in different machines or processes and support the respective process in monitoring. Thanks to the high accuracy of B + B products, we have grown into a reliable partner as a medical technology supplier over the years. Even in direct contact with body fluids, our products meet the European and international guidelines for medical technology.

In some OEM projects, we have already achieved groundbreaking new developments together with our customers and project partners, thus ensuring medical progress. Accompanying the product creation, we contribute to the creation of all necessary documents for a smooth certification - also according to the new medical device regulation "MDR" (Medical Device Regulation).

Our pressure transmitters, temperature and humidity sensors are used in a variety of ways and are used on devices in operating theaters, instrument cleaning and monitoring equipment. B + B products are also represented in laboratories, their instruments and systems. For example in magnetic stirrers, centrifuges, water baths and temperature control systems.

We are at your disposal whether you are dealing with high-precision sensors used in adult medicine or precision miniature products in pediatrics.
